# Fiscal costs of climate change

Jim Ebdon  
Head of Fiscal Risks and Sustainability  
21 Jan 2022

# Contents

- Introduction to the OBR and the Fiscal risks report
- The UK government on climate change so far
- Costs of decarbonising the UK economy by 2050
- Fiscal implications of the transition to net zero emissions
- Fiscal scenarios for achieving net zero emissions

# About the OBR

Created in 2010. Comprised of a 3 person council (BRC) plus around 40 civil servants

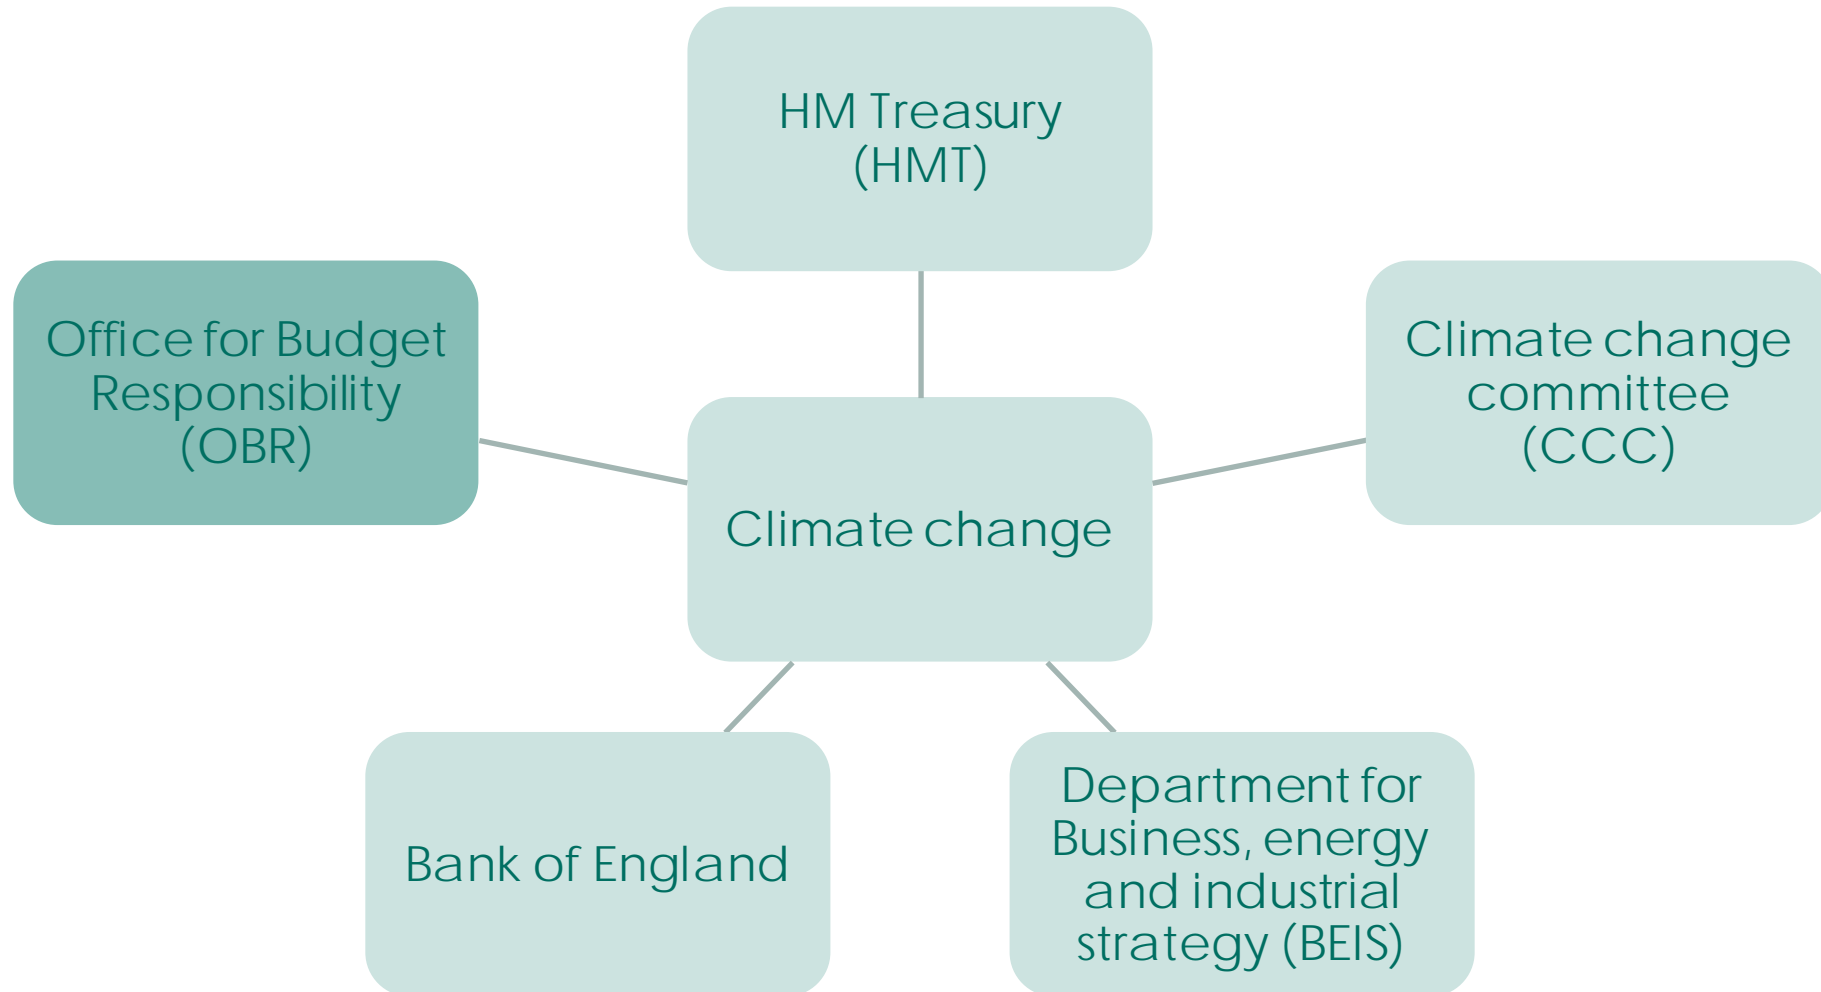

Remit:

- Budgets:
  - To produce five-year-ahead forecasts for economy and public finances
  - Evaluate the Government's performance against its fiscal targets
  - Scrutinize costing/scoring of Budget policy measures
- Other:
  - Fiscal Risks Reports
  - Fiscal Sustainability Reports
  - Welfare Trends

# Background on the Fiscal risks report

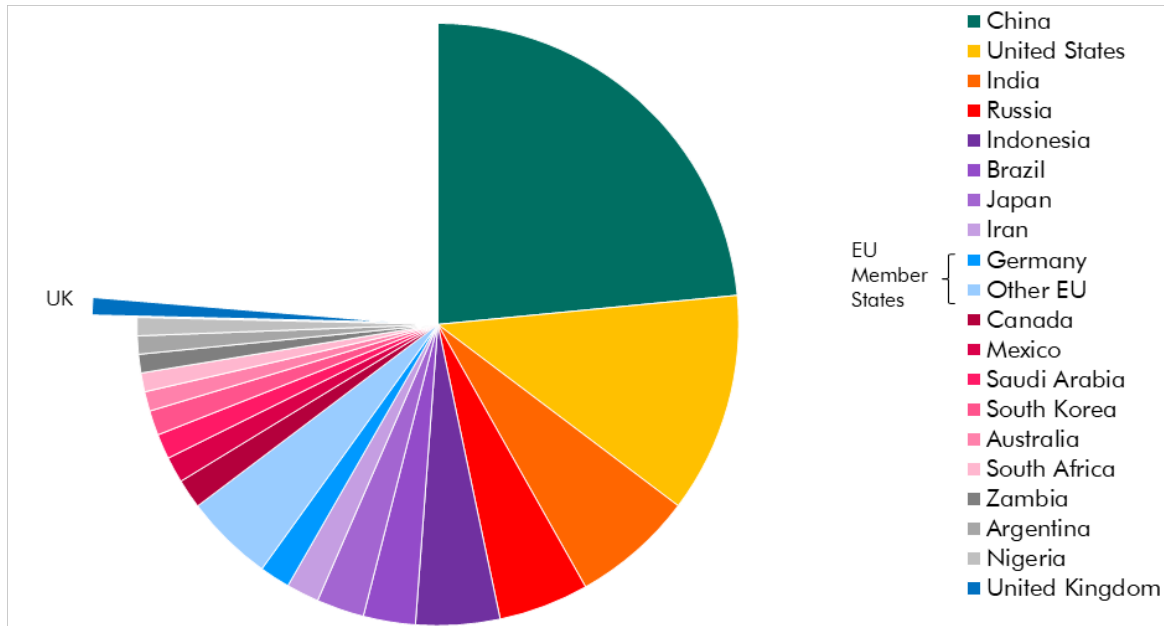

- OBR tasked with producing biennial *Fiscal risks report (FRR)* in 2015
- 2017 & 2019 FRRs took an 'encyclopaedic' approach to cataloguing 97 risks
- July 2021 FRR shifted the focus to three potentially catastrophic risks
  - Coronavirus pandemic (Chapter 2)
  - Climate change (Chapter 3)
  - Cost of public debt (Chapter 4)
  - Update on other risks (Chapter 5)

# Constructing fiscal scenarios

Baseline:

- OBR Long term economic determinants
- Assume capital spending is held at its 2025-26 level as a share of GDP and the current budget is held in balance.

Then for each scenario:

- Non-climate-related receipts
- Non-climate-related public spending
- Net zero public spending
- Net zero receipts losses
- Additional carbon tax revenues
- Debt interest consequences of any differences in borrowing.

# Net debt impact of reaching net zero

# Summary of climate-related scenario assumptions

|   | Real GDP<br>(per cent<br>deviation<br>from<br>baseline) | CCC<br>scenario for<br>whole<br>economy<br>costs <sup>1</sup> | OBR public<br>spending<br>share<br>variant | OBR<br>carbon-<br>related<br>revenue<br>loss variant | OBR<br>carbon tax<br>variant |
|---|---|---|--|--|------------------------------|
| Early action scenario                       | -1.4  | Balanced  | Central                                    | Central  | Early                        |
| Late action scenario                        | -4.6  | Late  | Late                                       | Headwinds  | Late                         |
| High productivity variant                   | 1.6   | Balanced  | Central                                    | Central  | Early                        |
| Low productivity variant                    | -4.4  | Balanced  | Central                                    | Central  | Early                        |
| High spending variant                       | -1.4  | Balanced  | High                                       | Central  | Early                        |
| Low spending variant                        | -1.4  | Balanced  | Low  | Central  | Early                        |
| Net zero investment from existing totals    | -1.4  | Balanced  | Central                                    | Central  | Early                        |
| Motoring tax revenues maintained            | -1.4  | Balanced  | Central                                    | Central  | Early                        |
| Investment included and motoring maintained | -1.4  | Balanced  | Central                                    | Central  | Early                        |

<sup>1</sup> 'Balanced' is the balanced net zero pathway

# Alternative fiscal scenarios toward net zero

Differences from baseline PSND under various scenarios

Source: OBR

# Conclusions

- Between now and 2050, the fiscal costs of reducing net emissions to zero in the UK could be **significant but not exceptional**.
- The largest fiscal cost of achieving net zero is the **loss of fuel duty receipts**.
- The UK has made good progress in reducing emissions, but there are greater challenges ahead.
- There could be significant fiscal benefits from transitioning to net zero sooner rather than later, not least the additional revenues that would come from taxing all emissions at higher rates.
- The costs of failing to get climate change under control would be much larger than those of bringing emissions down to net zero.

# Reflections

- This work has built on work from two other independent bodies.
  - Each has made their own assumptions.
  - Each has produced this work for their own purpose.
- By piecing them together, we have had to make many assumptions to try to be internally consistent.
- As a non-policy and non-advisory body, we are well placed to publish best guesses on fiscal shares of the overall cost and the carbon tax rate required.
- The uncertainty around any of these individual paths is large.

# October 2021: Measures in budget, spending review and net zero strategy

- Transparency – not just ‘good news’ but emissions increasing decisions
- Only able to show change in fiscal aggregate (£bn), not change in net emission (CO<sub>2</sub>e)
- Difficult to compare gross spending with net from FRR
- Spending focused on public sector estate or innovation,

|   | £ billion |         |         |         |         |         | Total |

<sup>1</sup> Some other tax measures that could affect emissions have not been included because their effects are small, temporary or uncertain.

# Next steps

## 1. Short run forecast

- Develop our UK Emissions Trading Scheme and Electric Vehicle forecasts. Need to improve regardless of climate change fiscal risk!

## 2. Long run forecast baseline

- Adaptation cost - damage in GDP growth from global emission stock. What forecasts to use for conditioning assumption?
- Transition cost - loss of motoring taxes

## 3. Understand emissions and proactively prepare for policy changes e.g. ETS expansion
